

BATTERY CARE STATION

RANGE OF SERVICES

The Battery Care Station (BCS) works as a recharging station for starter batteries which, due to long transport times between manufacturer (overseas) and the place of use (vehicle manufacturers in Europe), have a lower terminal voltage and are no longer in the acceptable voltage range to be installed in new vehicles.

Before reaching their final place of use, the batteries are received by the BCS during regular transport (e.g. unloading from the container after shipping) and immediately stored.

Products from outside of Europe that are subject to customs are kept in secure storage and accurately reported to customs.

TO ENSURE THE
QUALITY OF YOUR
BATTERIES.

Before delivering the batteries from the BCS storage to the respective vehicle manufacturers' plant, every single battery is checked for an appropriate terminal voltage and recharged if below the reference threshold. Additionally, the batteries are visually inspected for transit damage and color stamped to indicate recharging. Finally the batteries are repackaged and shipped as scheduled and in accordance with the manufacturer's call order. The described operational procedure is not only suitable for starter batteries, but also for all other battery systems, such as traction cells and stationary batteries.

Our processes are geared to the DIN ISO 9001 standard, but customer-specific processes can be accommodated without a problem. The BCS serves as quality control for your batteries!
